Backend Software Engineer · Go · Microservice Architecture · AI-Native SDLC

SUMMARY

Backend engineer with nearly 3 years designing, shipping, and operating 12+ Go microservices behind **JioTV+**, a multi-platform OTT product (STB, Android TV, iOS/Android, Web) serving millions of daily users. Builds and operates subscription, payment, and playback services end-to-end — API and schema design through security review, rollout, and incident response. Driving team-wide adoption of **AI-native engineering**: agentic workflows with Claude Code skills, sub-agents, lifecycle hooks, and MCP integrations into CI/CD. B.Tech, NIT Goa (CGPA 9.31).

TECHNICAL SKILLS

Languages: Go (goroutines, context propagation, middleware, DI), Node.js, Python, Bash, SQL

Data & Messaging: Cassandra / ScyllaDB (partition & clustering design), MongoDB, Redis, Bigtable, RabbitMQ

Platform: Kubernetes, Docker, GCP (GKE, GCS, Cloud Logging), Azure DevOps (CI/CD Pipelines, Repos, Boards), Git, Linux

APIs & Security: REST, OpenAPI/Swagger (spec-first), token-based auth, HMAC & signature validation, CDN & caching strategies, Fortify SAST, Black Duck SCA

AI-Native Dev: Claude Code (skills authoring, sub-agents, lifecycle hooks, slash commands, CLAUDE.md), MCP server integration, agentic code review & debugging workflows

WORK EXPERIENCE

Backend Software Engineer · JioTV+ — Jio Platforms Ltd.

Oct 2023 – Present

- **Go microservices ownership:** Own 12+ Go microservices spanning user, subscription, playback, metadata, screen, recommendation, and configuration domains — idiomatic handlers, middleware, context propagation, dependency injection; maintain the shared Go utilities module consumed by every service, with all API contracts spec-first OpenAPI under source control.
- **TVOD subscriptions & payments:** Designed and built subscription and rental purchase flows — REST API design, payment-gateway integration with server-to-server callbacks and recurring payments, Cassandra entitlement modeling, and playback gating (premium checks, device-ID management, device limits, geo-restriction); coordinated changes across 10+ microservices and authored the feature's application-security assessment.
- **Database migrations:** Migrated high-traffic services from MongoDB to Cassandra/ScyllaDB with schemas designed around dominant read paths (partition and clustering keys chosen for point-lookup reads); migrated user-personalization APIs from Bigtable to MongoDB.
- **Async processing — RabbitMQ & cron jobs:** Built RabbitMQ consumers syncing CMS content edits to downstream data stores routed by content type; own the scheduled-jobs service running catalog sync for OTT partners, live-channel EPG refresh, popularity-score updates, Elasticsearch index sync, and content-lifecycle automation — designed to be idempotent, replayable, and tolerant of partial failures.
- **Partner integrations & CMS:** Led end-to-end onboarding of major OTT content partners — catalog ingestion, subscription mapping, and playback enablement; built and maintain the Node.js CMS backend powering content ingestion, metadata workflows, and internal tooling.
- **Performance engineering:** Cut p95/p99 latency on playback, screen-layout, and recommendation APIs — eliminated N+1 query patterns with batched fetches, bounded goroutine concurrency with semaphores, prepared statements on hot Cassandra queries, and layered caching (in-memory pod-local cache → Redis → edge CDN) with expirations tuned to each data type's rate of change.
- **Live streaming, CDN & high availability:** Backend for high-availability live event and election streaming; led CDN traffic migration for the live-channel playback API with intelligent CDN routing during peak loads; built free-tier live playback flows, dynamic catch-up rails, and runtime feature-flag configuration for graceful degradation during traffic spikes — zero emergency deployments.
- **Security & auth:** Migrated token-based authentication across versioned codec layers; HMAC validation on internal endpoints and signature validation on configuration endpoints; team point-of-contact for application-security and privacy reviews (Fortify SAST, Black Duck SCA); lead triage and resolution of production incidents across playback and subscription services.
- **AI-native SDLC:** Driving team-wide agentic development — authored reusable Claude Code skills (OpenAPI generation, contract validation), sub-agents (API architect, code reviewer, debugger, security scanner, test writer) with scoped tool permissions, lifecycle hooks for lint / formatting / secret-scanning guardrails, custom slash commands, and MCP servers integrating Azure DevOps work items, pull requests, and pipelines with least-privilege access.

EDUCATION

B.Tech, Electronics & Communication Engineering — NIT Goa · CGPA 9.31

2019 – 2023

Senior Secondary (XII), M.P.C — FIITJEE Junior College, Vijayawada · CGPA 9.92

2017 – 2019

Secondary (X) — Camford English High School, Chittoor · CGPA 9.80

2016 – 2017
